Evaluation devices

Pulse Sensors (see ALSEN catalog TK 2 + 12.1)

The detection and evaluation of pulse rate and rotation speed for the automation of plant and machinery are our core competences. Since 1964 Klaschka has developed and manufactured

- non-contact, high resolution and fast pulse sensors,
- pulse rate measuring relays and converters,
- programmable logic controls with pulse counter,
- accessories such as pulse wheels (module 1) in various diameters, couplings, mounting parts and connecting leads.

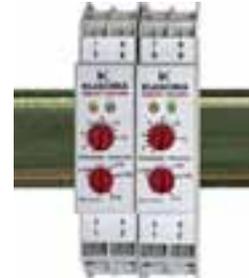

For decades, our sensors and devices have demonstrated our competence in detecting, modifying, monitoring and converting pulse rates, rotation speeds, frequencies, positions, linear and rotary speeds.

Klaschka also has many years of experience in combining these sensors and devices with programmable logic controls.

In this catalog you will find evaluation devices for pulse rate, rotation speed, frequency, and standstill.

You will find pulse sensors and switches in the ALSEN catalog.

Evaluation Devices for Pulse Rate, Rotation Speed, Frequency, and Standstill Overview

Measuring relays and converters for pulse rates and frequencies evaluate the signals from a pulse sensor for the generation of digital and analogue signals and switching commands.

The **ISN pulse rate measuring relay** can be used for monitoring standstill or nominal speed for a total of 4 ranges from **10 pulses / min ... 120 k pulses / min** all together.

The **FSN frequency measuring relay** completes the **ISN pulse rate measuring relay** by including high frequencies. Thresholds can be set to any frequency from **100 Hz ... 120 kHz** in 3 ranges.

The **IWA pulse rate converter** generates in **45 ranges** between **6 pulses / min ... 540 k pulses / min** at the output a signal analogue to the pulse rate.

The **IWAS pulse rate converter with measuring relay** is equipped with an additional limit value switch with relay output used for monitoring standstills or nominal pulse rates.

The **FWA Frequency converter** for pulse rates ranging from **3 Hz to 120 kHz** has the same purpose like the IWA pulse rate converter.

Terms

Start time bridging X: During the start bridging time, the status of the output relay is independent of the input signal of the measuring relay. Normally, the output relay remains pulled-in during this time.

Pull-in delay Y: The time between the monitored quantity exceeds or falls below the threshold and the output relay pulls- in.

Drop-out delay Z: The time between the monitored quantity exceeds or falls below the threshold and the output relay drops out.

Setting accuracy: Relative error which occurs when setting a threshold (variable) for a measuring relay relative to the required threshold value.

Hysteresis H: If a measuring relay is activated at the moment as the input signal exceeds value A and alters its switching status at the moment as the input signal falls below value B, the switching hysteresis is
$$H = (A - B) / A \times 100 \%$$

Residual ripple: If a DC voltage has the average value U_m and a ripple voltage with a peak-to-peak value of U_{SS} is superimposed on it, the residual ripple is
$$R = U_{SS} / U_m \times 100 \%$$

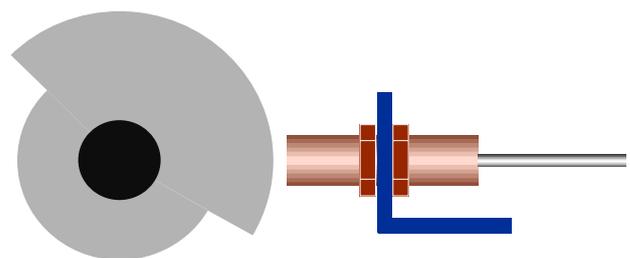

Threshold S: The value of the input quantity which, when exceeded, makes the relay change its status.

Duty cycle: Ratio of pulse to period duration.

Temperature influence: Percentage change in the threshold of a measuring relay resulting from a temperature change.

Power supply influence: Percentage change in the threshold of a measuring relay resulting from a change in the power supply.

Repeat accuracy: With constant operating conditions, the switching threshold of a measuring relay will vary above and below an average value within the indicated tolerance range.

Common technical data

Unless no other specifications are given in the single descriptions, the following data are valid for all our devices:

Power supply

AC	230, 115, 42, and 24 V AC
Tolerancy	± 10 %
Frequency	50 ... 60 Hz
DC	24 V DC
Tolerance range	± 15 %
Residual ripple	max. 10 %

Pulse sensors

Nominal voltage	24 VDC
Output current (terminal P)	max. 35 mA
Input current (terminal E)	approx. 10 mA

Signal levels of logical inputs

Level lo	0 ... + 4 V DC or open input
Level hi	+ 12 ... + 30 V DC

Output relays

Switching voltage	24 ... 250 V
Switching current	0.05 ... 6 A
Switching capacity	
AC	max. 1.250 VA
DC	max. 50 W
Switching frequency	max. 3.000 switching cycles / h
Lifetime	30 x 10 ⁶ switching cycles
Insulation group, open contacts	C / 250 according to VDE 0110
Test voltage, contact / coil	2.000 V
Bounce time	≤ 5 ms

Device design principle

acc. to VDE 0435 /11.94 EN60255-6

Operating mode

continuous

Ambient temperature range

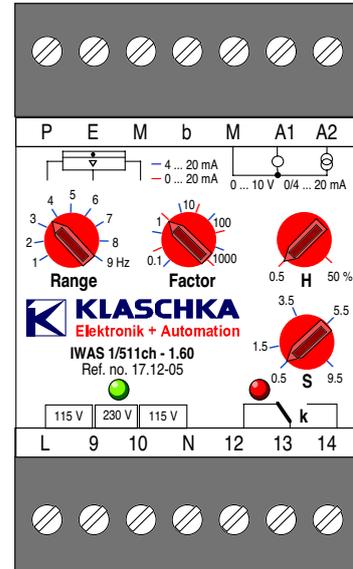

0 ... + 55 °C

Immunity to vibration

max. 4 g

Mounting orientation

arbitrary

Evaluation devices for Pulse Rate, Rotation Speed, Frequency and Standstill

Housing Data

Technical Data

Housing

- Designation	.24
- Housing material	PC-GF
- Housing of the isolation material	acc. to DIN 43880 with cage clamp terminals
- Protection rating acc. to IEC 60529	IP 40
- Colour	light grey according to RAL 7035
- Outer dimensions	see pictures

Terminals

- Number	4 rows, each with 2 clamps, per clamp with two interfaces
- Clamp material	stainless steel, blanc / copper alloy, tin-plated
- Max. terminal cross section	2 x 15 mm ² each
- Max. contact feed-through resistance	10 mΩ (to the circuit board)
- Max. current charge	10 A
- Insulation lengths of the leads	8 mm
- Protection rat. of connecting openings	IP 20 acc. to IEC 60529
- Protection against electric shock	acc. to VBG 4
- Colour	light grey acc. to RAL 7035

Lead fixing

- Type	cage clamp
- Tool	screw driver with cutting edge ISO 2380-1-B0, 5 x 3

Fixing of the housing

- 1) Snap-on attachment	on hat rail EN 50022
- 2) Snap-on attachment M4	90 mm grid with 2nd slider as accessory

Temperature range

- According to UL 746B	125 °C
- According to Vicat ISO 306 Meth. B	148 °C
- According to ISO 75-2 Math. A	138 °C
- According to ISO 75-2 Math. B	144 °C

Creepage distances and clearances

- Creepage current resistance	CTI 175 ^ = Insulation material III a (acc. to IEC 60664-1)
- Perpendicular circuit board clear. dist.	≥ 3.3 mm acc. to IEC 60664-1
- Perpendicular circuit board creep. dist.	≥ 4.5 mm acc. to IEC 60664-1
- Horizontal circuit board	≥ 4 mm

Net weight

42 g

Housing

- Designation	.60
- Protection rate acc. to DIN 40 050	IP 40
- Dielectric strength acc. to DIN 53 481	500 kV / cm
- Colour	light grey acc. to RAL 7035

Clamps

- Number	2 rows with 7 clamps each
- Clamp screw	captive, self-releasing
- Cross section of connecting leads	max. 4 qmm
- Nominal current	max. 20 A
- Protection rating according to DIN 40 050	IP 20
- Contact protection	according to VBG 4
- Colour	anthracite

Attachment

- standard rail	snap-on to standard rail according to DIN 46 277, page 3
-----------------	---

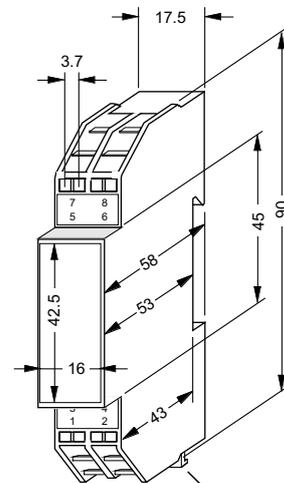

Temperature range

- 40 ... + 110 °C

Creepage distances and Clearances

acc. to VDE 0110	IGr C / 380 V AC
------------------	------------------

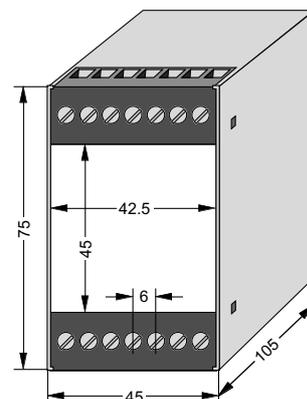

Housing .24 with 8 clamps

Unlocking at the bottom centre.

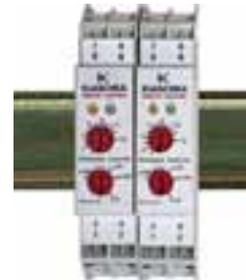

Keep mounting distance to the bottom of 10 mm.

Housing .60 with 14 clamps

Evaluation Devices for Pulse Rate

Characteristics

Pulse rate measuring relays (ISN) can be used for monitoring standstill or nominal pulse rates for a total of 4 measurement ranges between **10 pulses / min ... 120 k pulses / min**.

ISN pulse rate measuring relays are used to monitor plant or machinery parts. Equipped with proximity switches, they can detect the idle state or obligatory movements of machinery.

Applications

One example for an application is that they can detect the idle state or the minimum speed of conveyors. In another case the indication is possible whether an idle state has been achieved or not or a maximum speed can be signalled. Another example for an application is the monitoring of the rotation rate of a mixer. Before feeding it, the mixer should achieve normal operation speed.

ISN pulse rate measuring relays can operate in 4 measurement ranges, beginning

- with 10 to 120,
- with 100 to 1.200,
- with 1.000 to 12.000 and
- with 10.000 to 120.000 pulses per minute.

When closing the starting contact (SK) of the ISN 1/410ch-1.60 and ISN 1/411cq-1.60 the relay is held approx. 5 sec.

For the ISN pulse rate measuring relay, a frequency-dependent undetermined delay time of maximally $1/2f$ has to be considered.

Type ISN 1/410ch-1.60-(Uv)

Ref. no. 17.11-01

Type ISN 1/411cq-1.60-(Uv)

Ref. no. 17.11-02

Type ISN1/410ch-1.24

Ref. no. 17.11-07

Purpose

Extremely fast monitoring of rotation speeds for exceeding or falling below a threshold.

Applications

Monitoring the nominal speed or standstill of rotating parts in plant and machinery, vehicles, ships, processing technology, and in numerous other fields.

Function

A pulse sensor interrogates the rotating shaft. The period of the rectangular pulses generated is measured and converted with negligible delay into an analogue value proportional to the input frequency. This signal is available immediately after the first positive rectangular pulse edge. In mode a, the relay drops out when threshold S is exceeded (monitor for standstill); in mode b, the relay pulls-in when threshold S is exceeded (monitor for nominal speed). In addition, an external relay can be used to activate the start time bridging (relay pulled -in).

Hysteresis H and Times X, Y, Z

Version/410ch:

Hysteresis H fixed approx. 5% of S,
Start time bridging X fixed approx. 5 s,
Pull-in and drop-out delays Y, Z fixed approx. 50 ms.

Version/411cq:

Hysteresis H adjustable approx. 5 ... 50% of S,
Start time bridging X adjustable to approx. 25 s,
Pull-in and drop-out delays Y, Z adjustable together up to approx. 0.5 s.

See catalog pages **1.1.1.1**, **1.1.1.2**, and **1.1.1.3**

ISN Pulse Rate Measuring Relay

Device	Pulse Rate Measuring Relay ISN
For exact type designation and ref. no. see page 1.1.0.4	ISN1/410ch-1.24-24 VDC 17.11-07

Technical data	
Permitted operating range (L+, L-)	8 ... 24 ... 30 V DC
Power consumpt. without pulse sensor no load	< 35 mA
Operating temperature	0 ... + 55 °C
Operation mode	continuous
Housing	.24 (see housing data)
Weight	approx. 60 g
Input (E)	
Pulse sensors	see ALSEN catalog (TK 2)
More sensors	see ALSEN catalog (TK 1)
Input frequency	0.167 Hz ... 2.5 kHz
Permitted duty cycle	1 : 0.7 ... 1.3
Level lo	0 ... 1.5 V DC or open entry
Level hi	5 ... 30 V DC
Threshold S	adjustable 1 ... 12 pulses / min
Range switch-over	x10, x100, x1 k, x10 k
Hysteresis H	fixed approx. 5 % of S
Input current	max. 14 mA
Output (P)	
supply pulse sensor	
* max. current load capacity	≤ 100 mA
Output (A)	
signal output ISN	
Output type	without contact
Category	P-switching
Output voltage	operating voltage - 0.8 V DC
Current load	≤ 200 mA
Safety:	
Short-circuit proof ? / reverse polarity protect. ?	yes / yes
Indicators	
1 green LED	power on
1 LED yellow for the output:	
Operating mode a	exceeding treshold S
Operating mode b	falling below treshold S
Accuracy	
Setting accuracy	± 5 %
Temperature influence	± 3 %
Operating voltage influence	± 0.1 %
Accessory	
	sliders for screw fixing

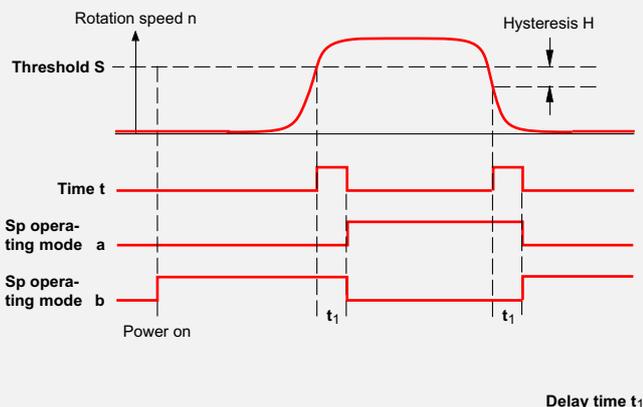

For common technical and housing data see catalog pages 1.0.1 to 1.0.4
For general description see catalog page 1.1.0.1

* For higher current loads an external power supply is necessary.

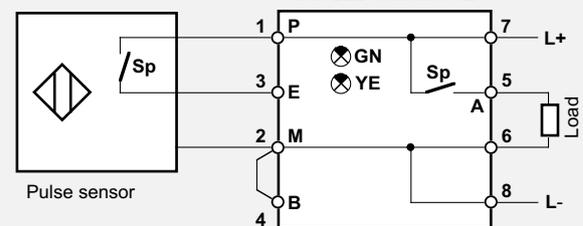

Range	Pulses / min	Frequency Hz	Delay time in ms
x 10	10 ... 120	0.167 ... 2	6.000 ... 500
x 100	0.1 k ... 1.2 k	1.67 ... 20	600 ... 50
x 1 k	1 k ... 12 k	16.7 ... 200	60 ... 5
x 10 k	10 k ... 120 k	167 ... 2 k	6 ... 0.5

Power supply U_v = 115 / 230 V AC

* For higher current loads an external power supply is necessary.

With power on, there is a Sk delay (start time bridging).
The pull-in/ drop-out delay is 0.5s Z/Y.

Range	Pulses/ min	Frequency Hz	Delay time ms
x 10	10 ... 120	0.167 ... 2	6.000 ... 500

1.1.1.3

Frequency Evaluation Devices

Characteristics

FSN Frequency and pulse rate measuring relays complete the **ISN pulse rate measuring relay** with high frequencies. Three threshold ranges from **100 Hz to 120 kHz** can be selected.

Type FSN 1/310ch-1.60-(Uv) **Ref. no. 17.11-03**

Type FSN 1/311cq-1.60-(Uv) **Ref. no. 17.11-04**

Purpose

They monitor whether a value exceeds or falls below a preset threshold.

Applications

As nominal frequency or standstill monitor of rotating parts in machinery or plant, in vehicles and ships, in mining, in process engineering as well as in many other ranges.

Function

A pulse sensor or encoder interrogate the rotating shaft (maximum frequency has to be considered) at entries E1 or E2 (for high frequencies). In mode a the relay k drops out when threshold S is exceeded (standstill monitor); in mode b the relay pulls-in when threshold S is exceeded (nominal rotation speed monitor). In addition, an external start contact (SK) can be used to activate the start time bridging X (relay pulled-in).

Hysteresis H and X, Y, Z times

Version/310ch:

Hysteresis H fixed approx. 5% of S,
start time delay X fixed approx. 5 s,
pull-in and drop-out delay Y, Z fixed approx. 50 ms.

Version/311cq:

Hysteresis H adjustable approx. 5 to 50% of S,
start time delay X adjustable up to 25 s,
pull-in and drop-out delay Y, Z together
adjustable up to 0.5 s.

See catalog pages **1.2.1.1** and **1.2.1.2**

Connection

Evaluation devices for pulse rates with analogue signal

Characteristics

The **IWA pulse rate converter** generates for a total of **45 ranges** between **0.06 pulses / min ... 540 k pulses / min** at its output a signal analogue to the pulse rate.

Type IWA 1/5-1.60-(Uv) Ref. no. 17.12-03

Purpose

Quick conversion of pulse rates and rotation speeds to proportional analogue currents or voltages. They cover a wide frequency range from 0.001 Hz to 9 kHz, corresponding to 0.06 up to 540 k pulses per minute.

Applications

For the open or closed-loop speed control of drives, or, as a substitute for expensive DC Tachodynamos (which are subject to wear), to indicate speeds of rotation.

Function

A pulse sensor interrogates the rotating shaft. The period of the rectangular pulses generated is measured and converted with negligible delay into an analogue value proportional to the input frequency. This signal is available at outputs A1 and A 2 immediately after each rectangular pulse.

Ranges

At two rotary switches a total of 45 ranges between the limiting values (1 ... 9 Hz x factor 0.1 ... 1000) can be set. Each linear measurement range covers from 1 to 100 % of the selected end-of-range value.

Analogue outputs

0 to 10 V, 0 or 4 mA to 20 mA. At the rotary switch for the factor, the lower limit for the current output can be set to either 0 or 4 mA.

In addition, the **IWAS** (on page 1.5.0.1) can monitor a preset threshold.

Connection

DC 3-pole

Evaluation devices for Frequency Rates with Analogue Signal

Characteristics

The **FWA Frequency Converter** for pulse rates ranging from **3 Hz to 120 kHz** has the same purpose like the IWA Pulse Rate Converter.

Applications

For the open and closed-loop speed control of drives, or, as a substitute for expensive DC Tachodynamos (which are subject to wear), to indicate speeds of rotation.

Type FWA 1/6-1.60-(Uv) Ref. no. 17.12-02

Purpose

Conversion of pulse rates and rotation speeds to a proportional analogue current or voltage. Frequencies range from 30 Hz to 120 kHz, corresponding to 1.8 k up to 7.2 million pulses per minute.

Function

A pulse sensor interrogates the rotating shaft. The integrator stage of the device converts the generated rectangular pulses to an analogue value which is proportional to the input frequency.

Pulse diagram

Wiring

Evaluation Devices for Pulse Rate with Threshold Monitoring

Characteristics

Type IWAS 1/511ch-1.60-(Uv) Ref. no. 17.12-05

Purpose

Quick conversion of pulse rates and rotation speeds to proportional analogue currents or voltages. They cover a wide frequency range from 0.1 Hz to 9 kHz, corresponding to 6 up to 540 k pulses per minute.

They monitor whether a value exceeds or falls below a preset threshold, i.e. they can function as a nominal rotation speed or standstill monitor.

Applications

For the open and closed-loop speed control of drives, or, as a substitute for expensive DC Tachometers (which are subject to wear), to indicate speeds of rotation.

Function

A pulse sensor interrogates the rotating shaft. The period of the rectangular pulses generated is measured and converted with negligible time delay into an analogue value proportional to the input frequency. This signal is available at outputs A1 and A 2 immediately after each rectangular pulse.

The output voltage is transmitted to a threshold value monitor which controls the output relay K. In mode a (no bridge between clamps b and M) the relay K drops out when threshold S is exceeded; in mode b (bridge between b and M) the relay pulls-in when threshold S is exceeded.

Ranges

At two rotary switches a total of 45 ranges between the limiting values (1 ... 9 Hz x factor 0.1 ... 1000) can be set. Each linear measurement range covers 1 to 100 % of the selected end-of-range value.

Analogue outputs

0 to 10 V, 0 or 4 mA to 20 mA. At the rotary switch for the factor, the lower limit for the current output can be set to either 0 or 4 mA.
